

The Consumer Decision Roadmap

11 prioritized use cases for U.S. Bank — acquire, deepen, defend

Prepared for Consumer & Business Banking leadership for roadmap and prioritization sign-off

The decision: approve a prioritized 11-use-case roadmap

U.S. Bank can capture ~\$105M in annual consumer value by deciding the right action at the moment each behavioural trigger fires. We have consolidated 31 signals into 11 decision plays and sequenced them to a first validated win in a quarter.

THE OPPORTUNITY

- ~\$105M addressable annual value across the consumer book
- 31 behavioural signals → 11 decision plays
- Spanning acquisition, deepening and retention

THE APPROACH

- TwinX decides and simulates each play before acting — not another propensity score
- Start with a ~\$47M no-regrets core that runs on internal data alone
- Validated with control groups, not a committed model score

THE ASK

- Greenlight the 11-play roadmap and its prioritization
- Approve the wave sequencing
- Fund two use cases

What we need from you today: Alignment on the use case roadmap and its classification, (2) the wave sequencing, and (3) the first two use cases.

Why now — primacy is won and lost in motion

The primary relationship — checking, the paycheck and bill pay — is eroding quietly as customers diversify and switch at life events and rate moments.

Primacy follows the paycheck

The primary bank is set by where checking, direct deposit and bill pay live — and customers increasingly split deposits across providers.

Soft-switching erodes quietly

~72% of additional and replacement accounts open at a different provider — and ~54% of those become the new primary.

Fintechs win the mass market

A leading neobank took ~12.8% of new-checking share in Q4 2025, ahead of the largest banks; incumbents still lead mass-affluent.

Life events drive the switch

Moves, marriage, divorce and new jobs trigger switching — new-mover targeting alone can onboard ~12,000 direct-deposit relationships a month.

Implication: the money moves at life events and rate moments, and primacy follows the paycheck. Winning it requires deciding the right action at the trigger — not a campaign after the fact.

U.S. Bank is built to win primacy — at scale

~13M

consumer clients

~\$512B

deposits

~2,100

branches — the primary-bank engine

80%+

consumer transactions digital

The franchise advantage

- Distribution, data and digital reach already in place
- A record 2025 — among the most efficient and profitable large-bank franchises
- Branches positioned as the primary-relationship acquisition vehicle

The opportunity for TwinX

- ~\$105M addressable annual value across the consumer book
- 31 behavioural signals consolidated into 11 decision plays
- ~\$47M no-regrets core captured on internal data alone

The assets are already here. TwinX turns U.S. Bank's distribution, data and digital reach into the right decision at every trigger.

Source: U.S. Bancorp investor materials (2025)

TwinX enables evidence-based decisions at every trigger

A score tells you who is likely to act. TwinX decides what to do, simulates it before you commit, and learns from the outcome.

The inversion: “if I target this household, what is P(open)?” becomes “the paycheck lands at a competitor — what treatment moves it, and what will they do back?” Vendors sell the score; TwinX owns the decision.

How TwinX decides — hypotheses, what-if, if-what

Every recommendation is the output of a four-step decision, not a lookup. This unpacks the DECIDE step.

In one line: point recommendations say what to do; the simulation says why, what else was considered, and what it is worth over 3, 6 and 12 months.

Three kinds of twin — prospect, customer, product

A twin is a simulatable model of a decision subject. TwinX builds three, and every use case runs on one or more of them.

PROSPECT TWIN

A household that does not yet bank with U.S. Bank

- Built from permissioned external data only
- Decides who to pursue, with what, and what wins the primary relationship

Powers → ACQUISITION

CUSTOMER TWIN

An existing customer or household

- Built from internal behaviour + permissioned external context
- Decides the next-best action for the relationship

Powers → DEEPENING & RETENTION

PRODUCT TWIN

A product or price — a rate, a card tier, a loan

- Tests a product or pricing change across the whole book before it is made
- Sits inside the customer and prospect twins

Powers → PRICING IN BOTH

Every recommendation is a decision, simulated before it ships: acquisition on prospect twins, deepening and retention on customer twins — and product twins price the offer in both.

11 decision plays across three pillars — ~\$105M addressable

ACQUISITION

Prospects · new-to-bank · prospect twins

~\$25M value pool

A1 Life-event new-household

\$12.2M · W3

A2 Primary-attach at money moment

\$12.4M · W3

DEEPENING

Existing customers · customer + product twins

~\$45M value pool

D1 Liquidity activation

\$17.6M · W1

D2 Card growth & upgrade

\$6.1M · W2

D3 Next-best lending (+ rider)

\$9.3M · W2

D4 Affluent / wealth attach

\$5.9M · W2

D5 Mono-line → primary conversion

\$6.3M · W1

RETENTION

Existing customers · customer twins

~\$29M value pool

R1 Deposit & rate-shopping defense

\$13.4M · W1

R2 Distress & disengagement save

\$9.3M · W1

R3 Affluent attrition defense

\$3.6M · W2

R4 Card-attrition save

\$3.0M · W2

W1 / W2 / W3 = roadmap wave · value = estimated annual pool · acquisition is new-to-bank prospects only

A1 · Life-event new-household

\$12.2M

PROSPECT TWIN

Win a household that does not yet bank here, the moment a life event reshapes where it banks.

Wave 3 · External (prospect)

BEHAVIOURAL TRIGGERS • Relocation / new-mover into footprint • New-baby spend signature • Marriage, cohabitation or new graduate	MODELS & DATA • Mover / relocation-prediction model • Life-event detection model • NTB checking-propensity + uplift • Data — external life-event, lifestyle, property, bureau	TWINX INTERVENTIONS • Segment to pursue (uplift) • Offer: cash / rate / switch-concierge • Channel + timing vs. the event • Incentive size — if-what optimum
SAMPLE OUTPUT · POINT RECOMMENDATION New-mover prospect, no USB tie → switch-concierge + \$300, mobile, week 2	SIMULATION · WHAT-IF / IF-WHAT What-if: mailer 8% → +digital+\$300 18% → +concierge 28%. If-what: minimum treatment that clears the LTV hurdle.	SIMULATED OUTCOME · 3 / 6 / 12 MO Cumulative value (accrues) 3mo +\$90 · 6mo +\$240 · 12mo +\$520
HOW TO ACTIVATE • Prospect feed → DM + branch concierge; suppress existing customers · Owner: acquisition marketing	ECONOMIC VALUE — HOW IT PAYS • Incremental primary households × ~\$1,800 3-yr LTV, net of treatment cost • Optimises the treatment mix (12%→28% conversion) and skips those who would convert anyway (uplift)	

\$12.4M

A2 · Primary-attach at the money moment

PROSPECT TWIN

Attach the primary relationship to a prospect at the highest-intent financial moment.

Wave 3 · External (prospect)

BEHAVIOURAL TRIGGERS • In-market mortgage shopper (bureau inquiry) • First pension / retirement deposit elsewhere • Large one-time inflow at a prospect	MODELS & DATA • Money-in-motion / large-inflow detection • Mortgage-intent (bureau trigger) model • Income / direct-deposit verification • Data — external bureau triggers, verified income, property	TWINX INTERVENTIONS • Where to attach (checking vs. hub) • Offer: rate-bonus vs. cash by moment • Channel + timing (pre-approval vs. closing) • Incentive size — if-what optimum
SAMPLE OUTPUT · POINT RECOMMENDATION In-market mortgage prospect → rate-bonus checking at closing, via loan officer	SIMULATION · WHAT-IF / IF-WHAT What-if timing: pre-approval 12% → at-closing 38% → post-funding 18%. If-what: \$50 rate beats \$300 cash here.	SIMULATED OUTCOME · 3 / 6 / 12 MO Cumulative value (accrues) 3mo +\$210 · 6mo +\$540 · 12mo +\$1,040
HOW TO ACTIVATE • Bureau-trigger feed → mortgage / relationship channel; closing-moment orchestration · Owner: lending × consumer	ECONOMIC VALUE — HOW IT PAYS • Funded primaries × revenue, net of subsidy — funded accounts earn ~2.4× unfunded • Times the attach to the money moment and matches offer-type to the prospect’s mindset (rate vs. cash)	

D1 · Liquidity activation

\$17.6M

CUSTOMER + PRODUCT TWIN

Route idle and incoming cash into the right yield product before it leaves.

Wave 1 · Internal-only

BEHAVIOURAL TRIGGERS

- >\$5K idle in checking 60d+
- Idle savings / MMA >\$50K at near-zero yield
- Tax-refund or bonus inflow

MODELS & DATA

- Idle-balance / liquidity model
- Yield-sensitivity / rate-elasticity model
- Cannibalisation + segment behaviour
- Data — internal balances, txns, DD/ACH; product twin: the rate card

TWINX INTERVENTIONS

- Which balance → which yield product
- The rate — solved, not picked (if-what)
- Timing + channel
- Treat-vs-hold (cannibalisation-aware)

SAMPLE OUTPUT · POINT RECOMMENDATION

\$42K idle in savings, retiree → 7-mo CD at +20bps; +35 over-pays, +10 loses it

SIMULATION · WHAT-IF / IF-WHAT

If-what: +20bps optimal vs +35bps (over-pays) / +10bps (loses balance). Product twin prices the offer across the book.

SIMULATED OUTCOME · 3 / 6 / 12 MO

Retained value (accrues)

3mo +\$180 · 6mo +\$390 · 12mo +\$610

HOW TO ACTIVATE

- In-app nudge + RM outreach for larger balances, near-real-time · Owner: deposits

ECONOMIC VALUE — HOW IT PAYS

- Activated balances × net interest margin, less rate give-up
- Product twin solves the minimum rate that holds the balance — margin protected; the biggest internal-only pool

D2 · Card growth & upgrade

\$6.1M

CUSTOMER + PRODUCT TWIN

Grow card share and migrate eligible holders to premium.

Wave 2 · Mostly internal

BEHAVIOURAL TRIGGERS • Competitor-card payment from a USB account • Basic-tier holder, premium-eligible spend • Rising spend velocity	MODELS & DATA • Share-of-wallet / spend-shift model • Premium-eligibility / upgrade-propensity • Competitor-card response (cross-elasticity) • Data — internal card + external-spend; product twin: card tiers	TWINX INTERVENTIONS • Capture-vs-upgrade decision • Offer: rewards / APR / fee waiver • Reward size for net margin (if-what) • Timing; competitor-aware
SAMPLE OUTPUT · POINT RECOMMENDATION Basic-tier, \$31K external spend → premium upgrade + first-year fee waiver	SIMULATION · WHAT-IF / IF-WHAT What-if: bonus-only → partial shift; upgrade + bonus → full capture. If-what: reward that maximises net interchange.	SIMULATED OUTCOME · 3 / 6 / 12 MO Net annual margin (accrues) 3mo +\$40 · 6mo +\$110 · 12mo +\$190
HOW TO ACTIVATE • In-app + statement + RM · Owner: cards	ECONOMIC VALUE — HOW IT PAYS • Captured off-us spend × interchange margin + upgrade revenue, net of rewards • TwinX picks capture-vs-upgrade per customer and sizes rewards to the margin actually at stake	

\$9.3M

D3 · Next-best lending (+ protection rider)

CUSTOMER + PRODUCT TWIN

Offer the next-best loan the moment the need appears; attach protection.

Wave 2 · Mixed data

BEHAVIOURAL TRIGGERS • Home equity built >50% • High external finance charges (costly debt elsewhere) • Auto-lease maturity ≤90d	MODELS & DATA • Credit-need / next-best-product model • Equity + approval-odds model • Rider attach-propensity • Data — internal + property, bureau, auto; product twin: loans	TWINX INTERVENTIONS • Which loan (HELOC / consolidation / auto) • Size to approval odds × value • Attach protection rider • Pricing; channel + timing
SAMPLE OUTPUT · POINT RECOMMENDATION Equity 58% + costly external debt → HELOC consolidation + protection rider	SIMULATION · WHAT-IF / IF-WHAT What-if: consolidation loan → lower value; HELOC → highest. If-what: offer maximising risk-adjusted take-up × margin.	SIMULATED OUTCOME · 3 / 6 / 12 MO Value captured (accrues) 3mo +\$120 · 6mo +\$300 · 12mo +\$430
HOW TO ACTIVATE • Pre-approved digital offers + banker · Owner: consumer lending	ECONOMIC VALUE — HOW IT PAYS • Risk-adjusted loan balances × margin + rider attach, net of acquisition cost • TwinX selects the next-best product the customer actually takes — not the highest-margin one	

D4 · Affluent / wealth attach

\$5.9M

CUSTOMER TWIN

Attach wealth to mass-affluent households with no USB wealth relationship.

Wave 2 · Mixed data

BEHAVIOURAL TRIGGERS

- Investable assets >\$100K, no USB wealth
- Large deposit inflows
- Pre-retirement life-stage

MODELS & DATA

- Affluence / investable-assets estimation
- Wealth-attach propensity
- Adviser-fit / routing model
- Data — internal + investable-asset estimate, wealth band

TWINX INTERVENTIONS

- Attach motion + sequencing
- Which adviser to route to
- Offer
- Timing

SAMPLE OUTPUT · POINT RECOMMENDATION

Est. \$240K investable, no wealth tie → adviser intro + portfolio review

SIMULATION · WHAT-IF / IF-WHAT

What-if: digital-only → low convert; adviser-led → converts. If-what: routing + offer maximising AUM per contact.

SIMULATED OUTCOME · 3 / 6 / 12 MO

Annual revenue (accrues)

3mo +\$280 · 6mo +\$720 · 12mo +\$1,200

HOW TO ACTIVATE

- Adviser routing + digital wealth entry · Owner: wealth × consumer

ECONOMIC VALUE — HOW IT PAYS

- Incremental wealth AUM × fee, net of adviser cost
- Deepens the mass-affluent franchise — the segment where incumbents still lead the neobanks

D5 · Mono-line → primary conversion

\$6.3M

CUSTOMER TWIN

Convert single-product and card-only customers into full primary relationships.

Wave 1 · Internal-only

BEHAVIOURAL TRIGGERS • New-payroll direct deposit detected • Card-only, no USB checking • Small-business inflows, no business account	MODELS & DATA • Payroll / income-event detection • Primary-conversion propensity • Uplift model • Data — internal DD/ACH, card, ledger; external income uplift	TWINX INTERVENTIONS • Conversion offer (DD-incentive) • Channel: in-app at the signal • Timing — speed at the trigger • Incentive size — if-what optimum
SAMPLE OUTPUT · POINT RECOMMENDATION Card-only, payroll detected → checking + DD-incentive, in-app, now	SIMULATION · WHAT-IF / IF-WHAT What-if: branch mailer → low lift; in-app at signal → converts. If-what: offer + timing maximising lift per \$.	SIMULATED OUTCOME · 3 / 6 / 12 MO Cumulative value (accrues) 3mo +\$110 · 6mo +\$280 · 12mo +\$520
HOW TO ACTIVATE • In-app + servicing prompts at the signal, near-real-time · Owner: consumer deepening	ECONOMIC VALUE — HOW IT PAYS • Converts single-product customers to primary at low cost — 3–4× relationship value • TwinX fires in-app at the income signal and sizes the incentive to the minimum that converts (uplift)	

R1 · Deposit & rate-shopping defense

\$13.4M

CUSTOMER + PRODUCT TWIN

Hold the deposit and the primary relationship before the balance leaves.

Wave 1 · Mostly internal

BEHAVIOURAL TRIGGERS

- Direct-deposit cessation; balance drift
- High-yield outflows up 50%+
- Mortgage rate-shopping; CD maturity ≤60d

MODELS & DATA

- Deposit-flight / balance-drift model
- Attrition / survival model
- Rate-shopping detection + uplift
- Data — internal balances, DD/ACH, CD + bureau inquiry; product twin: rate/CD

TWINX INTERVENTIONS

- Retention move (CD / rate / relationship)
- Minimum give-up (if-what)
- Who-to-treat (uplift — don't overpay)
- Timing

SAMPLE OUTPUT · POINT RECOMMENDATION DD ceased → direct bank → targeted 9-mo CD at retention rate, RM call, T+0	SIMULATION · WHAT-IF / IF-WHAT If-what: targeted CD optimal vs blanket rate (over-pays the book). Uplift suppresses non-flight-risk.	SIMULATED OUTCOME · 3 / 6 / 12 MO <i>Balance retained (decays)</i> 3mo \$9.1K · 6mo \$7.6K · 12mo \$6.9K
--	---	---

HOW TO ACTIVATE

- Real-time alert → RM + digital · Owner: deposits / retention

ECONOMIC VALUE — HOW IT PAYS

- At-risk balances retained × net interest margin, less targeted give-up
- Prices only the actual flight risk — so defence is margin-positive, not a rate-sheet drain (the give-up is the profit)

R2 · Distress & disengagement save

\$9.3M

CUSTOMER TWIN

Catch relationships sliding into distress or dormancy and re-engage.

Wave 1 · Internal-only

BEHAVIOURAL TRIGGERS

- 2+ service contacts + balance decline
- Repeat overdraft / NSF
- Dormancy; branch disruption

MODELS & DATA

- Distress / financial-stress model
- Disengagement / dormancy model
- Churn / survival model
- Data — internal service, overdraft, login, branch

TWINX INTERVENTIONS

- Save action matched to the signal
- Service recovery / fee / re-engage
- Channel + timing
- Least-cost save (if-what)

SAMPLE OUTPUT · POINT RECOMMENDATION

3 service contacts, balance -18% → proactive outreach + fee waiver

SIMULATION · WHAT-IF / IF-WHAT

What-if: no action → churns; outreach + waiver → recovers. If-what: lowest-cost action that retains per distress type.

SIMULATED OUTCOME · 3 / 6 / 12 MO

Relationship value retained (decays)

3mo \$2.1K · 6mo \$1.9K · 12mo \$1.7K

HOW TO ACTIVATE

- Service + digital re-engagement · Owner: servicing / retention

ECONOMIC VALUE — HOW IT PAYS

- Retained relationship value × save-rate, net of action cost
- TwinX matches the cheapest effective save to each distress signal, instead of a blanket discount

R3 · Affluent attrition defense

\$3.6M

CUSTOMER TWIN

Defend high-value relationships showing decline before they leave.

Wave 2 · Internal-only

BEHAVIOURAL TRIGGERS

- High-value relationship
- Balance and engagement both declining
- Adviser-contact lapse

MODELS & DATA

- Affluent-attrition / survival model
- Engagement-decline model
- Value-at-risk prioritisation
- Data — internal balance + engagement trend (defend-arm of D4)

TWINX INTERVENTIONS

- Priority by value-at-risk
- Adviser intervention + routing
- Offer
- Timing

SAMPLE OUTPUT · POINT RECOMMENDATION

–22% balance + engagement → priority adviser intervention, by value-at-risk

SIMULATION · WHAT-IF / IF-WHAT

What-if: standard outreach → drifts; adviser-led → stabilises. If-what: maximise retained AUM per adviser-hour.

SIMULATED OUTCOME · 3 / 6 / 12 MO

Revenue protected (decays)

3mo \$7.4K · 6mo \$6.8K · 12mo \$6.1K

HOW TO ACTIVATE

- Adviser-led intervention · Owner: wealth × retention

ECONOMIC VALUE — HOW IT PAYS

- Retained affluent AUM × fee; small population, high unit value
- Prioritises by value-at-risk so scarce adviser time defends the most revenue (defend-arm of D4)

R4 · Card-attribution save

\$3.0M

CUSTOMER + PRODUCT TWIN

Save card relationships shifting spend to a competitor.

Wave 2 · Mostly internal

BEHAVIOURAL TRIGGERS

- Card spend down 40%+
- Balance shifting to a competitor card
- Reward-redeem then dormancy

MODELS & DATA

- Card-attribution / survival model
- Spend-shift model
- Competitor response (cross-elasticity)
- Data — internal card-spend + competitive share; product twin: card

TWINX INTERVENTIONS

- Save: reward / APR / benefit
- Size to margin-at-risk (if-what)
- Timing
- Competitor-aware

SAMPLE OUTPUT · POINT RECOMMENDATION

Spend -44% → competitor → targeted bonus-rewards save, sized to margin

SIMULATION · WHAT-IF / IF-WHAT

What-if: reward-only → partial; reward + APR → retains. If-what: reward that retains at positive margin.

SIMULATED OUTCOME · 3 / 6 / 12 MO

Margin retained (decays)

3mo \$250 · 6mo \$230 · 12mo \$210

HOW TO ACTIVATE

- In-app + targeted offer · Owner: cards / retention

ECONOMIC VALUE — HOW IT PAYS

- Retained card margin × save-rate, net of reward cost
- TwinX sizes the save to the interchange margin actually at risk. Built as the defend-arm of D2

Prioritization — value × data-feasibility

NO-REGRETS CORE (WAVE 1) • D1 Liquidity activation — \$17.6M • R1 Deposit & rate-shopping defense — \$13.4M • D5 Primary conversion · R2 Distress save	ACQUISITION WAVE (WAVE 3) • A1 Life-event new-household — \$12.2M • A2 Primary-attach at money moment — \$12.4M • New-to-bank prospects · prospect twins
FAST-FOLLOW (WAVE 2) • D3 Next-best lending — \$9.3M • D4 Affluent attach — \$5.9M · D2 Card — \$6.1M	BRANCHES, NOT BUILDS • R3 / R4 — defend-arms of D4 / D2 • Protection rider — part of D3 • Built as twin branches

INTERNAL DATA ONLY → build now

EXTERNAL-DATA GATED → now unlocked

THE WEDGE

~\$47M

the Wave 1 no-regrets core — high value, internal data only, fastest to a validated win

Sequence the prospect acquisition wave behind it, once U.S. Bank permissions external data.

Roadmap — three waves, value compounding from a quarter out

Thank You
